

Does LED Light produce Heat ?

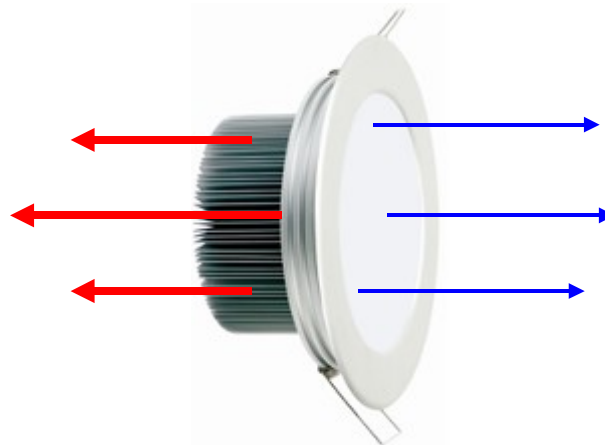

Yes, heat is being produced in LEDs lightings, however the amount of heat produced is much lesser than conventional lightings.

Eg: Energy conversion efficiency is higher where more light than heat is being convert from power

Heat created from LEDS lights is in the opposite direction compare to conventional lights. Therefore heat can be contained instead of dispersion into the User's environment.

Heat Disperse
from the back
which is over
the ceiling
partition

No heat
disperse
from the
front
